FUNCTIONAL AND PERFORMANCE TESTING

Performance Testing

Date	11 October 2026
Team ID	SWTID-2026-7837
Project Name	Streamlining IT Procurement: Automating Standard Laptop Orders with Flow Designer

1. Performance Testing Overview

Performance testing for this project focuses on verifying that the Standard Laptop Procurement automation responds correctly and completes the defined workflow without unnecessary manual intervention. The assessment covers the transition from an approved Standard Laptop request through Flow Designer to Catalog Task creation and assignment to the Hardware team.

2. Performance Testing Objectives

• Verify that the automation starts correctly when a Standard Laptop request is approved.

• Verify that the Catalog Task is created as part of the automated workflow.

• Verify that the generated Catalog Task is assigned to the Hardware team.

• Verify that the workflow completes the defined approval-to-task transition consistently.

• Identify failures or delays in task creation and assignment.

• Confirm that the automated process reduces the need for manual task creation and assignment.

3. Performance Test Scenarios

Test ID	Test Scenario	Expected Result	Status
PT-01	Approved Standard Laptop request triggers the configured Flow Designer automation.	Flow execution starts for the approved request.	Pass / Fail
PT-02	Flow processes an approved request and reaches the Catalog Task creation step.	A Catalog Task is created automatically.	Pass / Fail
PT-03	Generated Catalog Task is checked for Hardware team assignment.	The Catalog Task is assigned to the Hardware team.	Pass / Fail
PT-04	Complete approval-to-task workflow is observed from start to finish.	The defined workflow completes without requiring manual task creation or assignment.	Pass / Fail
PT-05	Multiple approved Standard Laptop requests are processed using the configured automation.	Each approved request follows the same defined task creation and assignment process.	Pass / Fail
PT-06	Workflow is checked for processing issues during normal project usage.	No unnecessary workflow interruption or configuration-related failure is observed.	Pass / Fail

4. Performance Parameters

Parameter	Evaluation Focus	Expected Outcome
Trigger Responsiveness	Time/behavior from approval of the Standard Laptop request to Flow Designer execution.	Automation starts correctly after the request reaches the approved state.
Task Creation Efficiency	Behavior of Catalog Task creation after the automation starts.	Catalog Task is created automatically without manual intervention.
Assignment Efficiency	Behavior of task assignment after Catalog Task creation.	Task reaches the Hardware team through the configured automation.
Workflow Consistency	Repeatability of the process for approved Standard Laptop requests.	Requests follow the same defined approval-to-task process.
Process Reliability	Occurrence of failures or interruptions in the configured workflow.	No unexpected failure in the tested normal workflow.
Manual Effort	Amount of manual intervention required after approval.	No manual Catalog Task creation or assignment is required in the automated path.

5. Test Procedure

Submit or identify a Standard Laptop procurement request through the Service Catalog.

Allow the request to proceed through the approval process.

Approve the Standard Laptop request.

Observe the configured Flow Designer automation.

Verify that a Catalog Task is created automatically.

Verify that the generated Catalog Task is assigned to the Hardware team.

Repeat the scenario with additional approved Standard Laptop requests to check consistency.

Record the observed results and any workflow issues.

6. Performance Test Result Recording

The following table can be completed during project demonstration or validation. The project materials define the expected automated behavior but do not provide measured execution-time benchmarks. Therefore, no unsupported response-time values are stated.

Test ID	Observed Result	Execution Time (if measured)	Final Status
PT-01	_____	_____	_____
PT-02	_____	_____	_____
PT-03	_____	_____	_____
PT-04	_____	_____	_____
PT-05	_____	_____	_____
PT-06	_____	_____	_____

7. Performance Acceptance Criteria

• The Flow Designer automation is triggered for an approved Standard Laptop request.

• A Catalog Task is created automatically.

• The Catalog Task is assigned to the Hardware team.

• The workflow completes without requiring manual Catalog Task creation or assignment.

• Repeated approved requests follow the same configured workflow.

• No unsupported performance benchmark is claimed without an actual measurement.

8. Conclusion

The performance testing plan verifies the operational behavior of the Standard Laptop Procurement Automation workflow. The primary focus is the reliability and consistency of the approval-to-Catalog Task transition, including automatic task creation and Hardware team assignment. Actual execution-time measurements can be recorded during demonstration or validation; the project documentation does not specify fixed response-time targets.
